Rear suspension rocker update			

The rear rocker 2022 spec had some early failures at certain landing conditions on one tire. Due to that reason, an updated rear rocker has been designed and will be included in the catalogue and will be homologated in the RX2e class by 15th September 2022.

- New rocker is 25% stronger than the baseline at 0° angle between pushrod/rocker.
 - New rocker is 190% stronger than the baseline at 7° angle between pushrod/rocker.
- The usage of Q054R18L9001A (2021 rear rocker) will be authorized & homologated for all races from now and until new ref. Q054R18L8001B (2022 updated spec) starts to be sold.
